

EnvGuard - Official Product Documentation

1. Overview

EnvGuard is a framework-agnostic environment file manager built specifically for Visual Studio Code. It is designed to take the pain out of managing configuration files (`.env`, `.properties`, `.yaml`) across large and complex workspaces. Whether you are building with Laravel, Node.js, Spring Boot, React, or .NET, EnvGuard ensures that your local, staging, and production environments remain perfectly in sync.

Why EnvGuard?

Configuration drift is one of the most common causes of deployment failures. A developer might add a new `STRIPE_API_KEY` to their local `.env` file but forget to add it to `.env.example` or `.env.production`. EnvGuard solves this by visually auditing and comparing your environment files, instantly flagging any missing keys or inconsistencies.

2. Core Features

1. Smart Environment File Discovery

EnvGuard automatically scans your entire workspace to locate configuration files.

- **Supported Formats:** `.env`, `.env.*` (local, production, test, etc.), `application*.properties`, and `application*.yaml|yml`.
- **Intelligent Filtering:** Automatically skips irrelevant directories such as `node_modules`, `vendor`, build outputs, and `virtualenvs` to ensure blazing-fast performance.

2. Unified Parsing Engine

Different frameworks use different configuration formats. EnvGuard normalizes them all into a unified `key = value` structure.

- Nested YAML structures are intelligently flattened using dot notation (e.g., `spring.datasource.url`).
- This allows you to effortlessly compare a Spring Boot `.yaml` config directly against a `.properties` or `.env` file.

3. Side-by-Side Comparison Tool

Select any two configuration files (for example, `.env.example` vs. `.env`) and instantly see the differences.

- Highlights **Missing Keys**.
 - Highlights **Extra Keys**.
 - Highlights **Value Differences**.
- Results are displayed beautifully in a dedicated sidebar view and an extended report panel.

4. Missing Key Detector (Auto-Audit)

EnvGuard actively audits all files of the same format against each other. If `APP_SECRET` exists in your development `.env` but is missing from `.env.production`, EnvGuard will flag it immediately, preventing potential production crashes before they happen.

5. Exportable Reports

Need to share configuration inconsistencies with your DevOps team or fellow developers? EnvGuard allows you to export a complete audit report as `report.json` to your workspace root with a single click.

6. Click-to-Navigate

Every key displayed in the EnvGuard sidebar or report panel is fully interactive. Simply click on a missing or mismatched key, and VS Code will immediately open the file and jump to the exact line number, allowing for lightning-fast fixes.

3. Privacy & Security

EnvGuard is built with enterprise-grade security principles:

- **100% Local Processing:** Your environment files contain highly sensitive secrets, API keys, and database credentials. EnvGuard processes everything entirely on your local machine.
 - **Zero Telemetry:** We track absolutely nothing.
 - **No Network Calls:** The extension makes zero external HTTP requests.
 - **No Accounts Required:** Install the extension and start using it instantly.
-

4. Getting Started

1. **Installation:** Download and install EnvGuard from the Visual Studio Code Marketplace.
 2. **Access the Panel:** Click on the shield icon (EnvGuard) in the VS Code Activity Bar on the left.
 3. **Scan:** Click the "Refresh" (↻) icon to discover all environment files in your active workspace.
 4. **Compare:** Hover over any two files in the list, right-click, and select "Compare Files", or use the inline navigation icons.
 5. **Fix:** Review the "Missing Keys" and "Comparison Results" panels. Click on any flagged item to navigate directly to the source code and apply your fixes.
-

5. Contact & Support

- **Publisher:** Tuhin
- **Version:** 1.0.0
- **License:** MIT
- **Feedback & Issues:** Please visit our GitHub repository to submit feature requests or report any bugs.
